Demo Study: Page-Aware Retrieval for Scientific Papers

Abstract

This synthetic example tests a page-aware retrieval workflow for research-paper PDFs.

It is provided only to test PaperPilot; every result and number is fictional.

Introduction

Scientific articles can be difficult to review when evidence is spread over many pages.

Methods

We use overlapping text chunks, section labels, and page metadata for evidence retrieval.

A small synthetic benchmark contains 120 papers and 600 manually written questions.

Results

In this fictional test, page-aware retrieval improves evidence precision by 14 percent.

Limitations

This invented example uses only selectable English text and does not evaluate scanned PDFs.

Conclusion

Page references can help readers verify summaries against the original article.
